

SOLAR COMFORT PRESENTS:

YESTERDAY: All you could get to shade your home was those black screens that did provide some shading, but they created heat that was held against your windows and the obscured your view.

Well.... That was yesterday and now the rules have changed! You do not have to put up with ugly black screens that do not offer the level of radiant protection that you deserve for your home.

New SOLAR COMFORT RADIANT BARRIERS are the ultimate in radiant protection.

Developed by NASA, radiant barriers reflect the raw radiant energy (cold electromagnetic energy from the sun) that converts into heat when it strikes a surface.

So why use ugly black material that will convert the maximum amount of heat from the sun and hold it against your window? Get rid of it before it converts to heat inside or on your windows.
